

COVID-19 Macro for Genetec Synergis™ Access Control

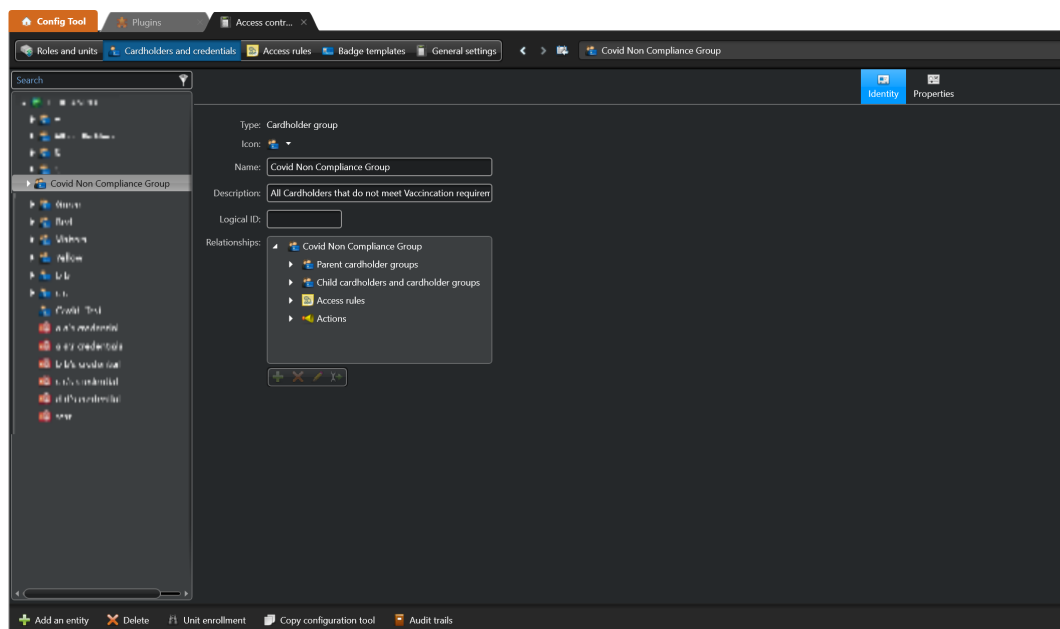

BCD's COVID-19 Macro for Genetec Synergis™ Access Control gives end-users the flexibility they need to both manage their access control system while also staying on top of employee COVID-19 status changes. With ad hoc rules continuously being put in place to control the spread of the virus, this macro can automate the decision-making process for human resource departments or governing bodies by pushing those decisions directly to access control systems without the involvement of a security practitioner or administrator.

HOW DOES IT WORK?

Developed by BCD's team of software engineers, this easy-to-use macro can be installed on Security Center/Synergis to assist in the management of COVID-related access control rules. The macro allows a .csv file from an HR portal, COVID or health screening platform to be uploaded into Synergis. With the ability to integrate a company's HR portal for COVID and/or vaccination status updates, access control rules can automatically be changed without the hassle of having to log in to the payroll or HR system to manually update permissions.

Key features include:

- Cardholder group is used to apply implicit “deny” access permissions
- Base macro is designed for .csv to have employee ID, cardholder name, and “add/remove” designation
- Base macro assumes “employee ID” custom field
- Macro validated on Security Center 5.8+

You can download the macro at no charge, [here](#).
