

## BCD Harmonize Plug-in User Guide

### Compatibility

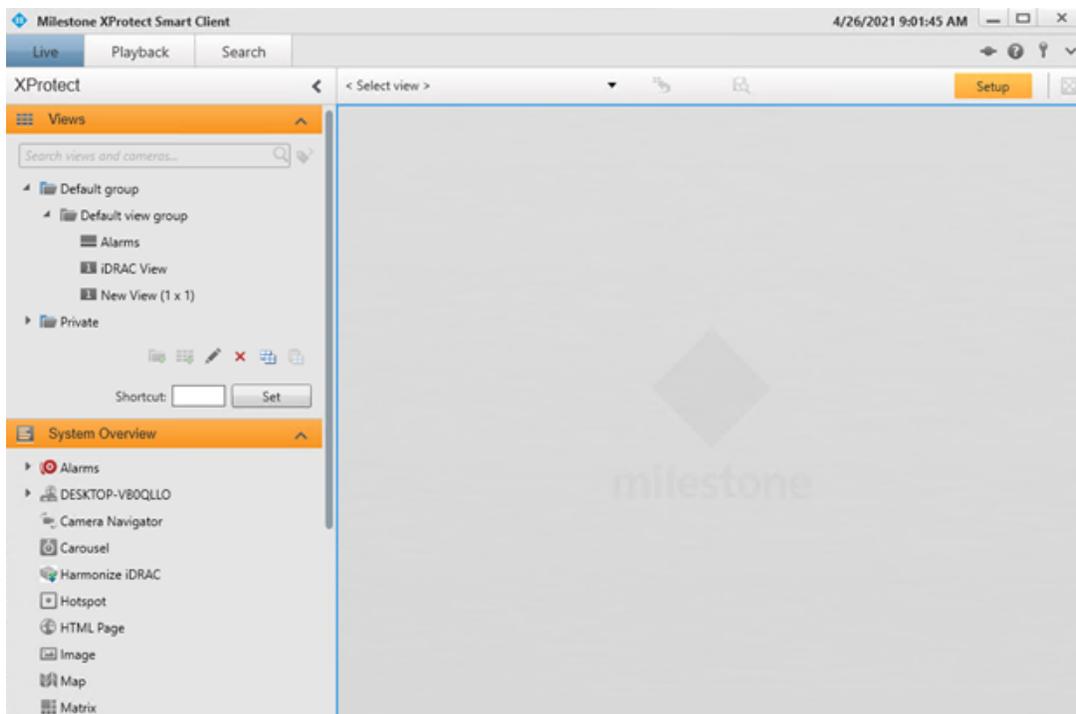

- The Harmonize iDRAC plugin is compatible with XProtect 2020 R3
- iDRAC 9w / Lifecycle Controller 3.36.36.36
- iDRAC Virtual Console will require an iDRAC Enterprise License
- The XProtect Event Server service will need to be running under a user account that is an admin on the server machine in order to get some of the data points

### Setting Up A View Pane

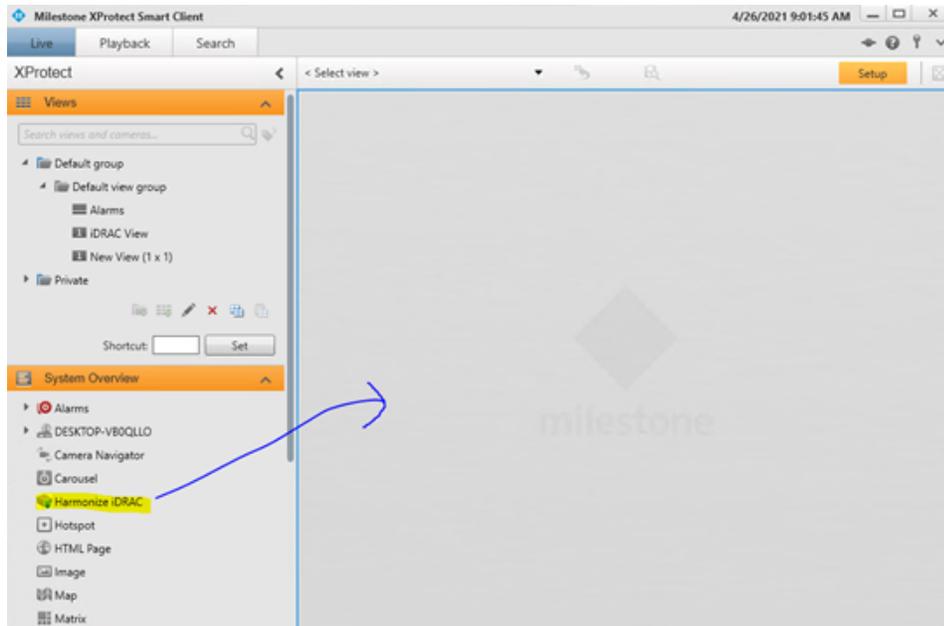

- Launch the XProtect Smart Client and log in.
- Enter setup mode.
- Create a view (refer to XProtect manual for directions)

### Associating A Pane With An iDRAC Node

Drag the Harmonize iDRAC node to a pane and drop it there.

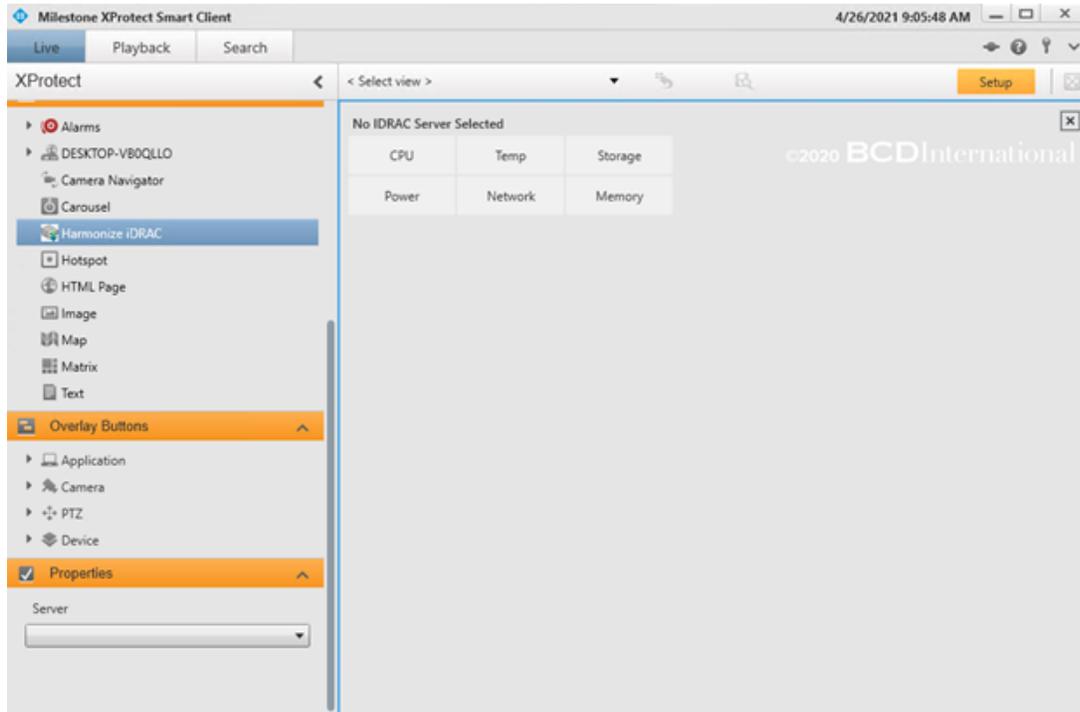

(clean template provided so that editor can provide better graphics)

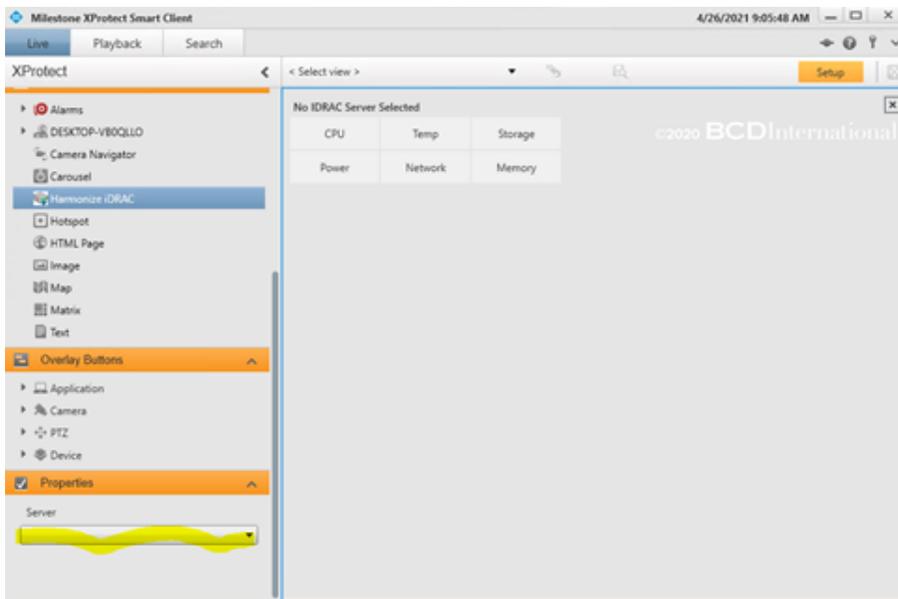

## Selecting iDRAC Node

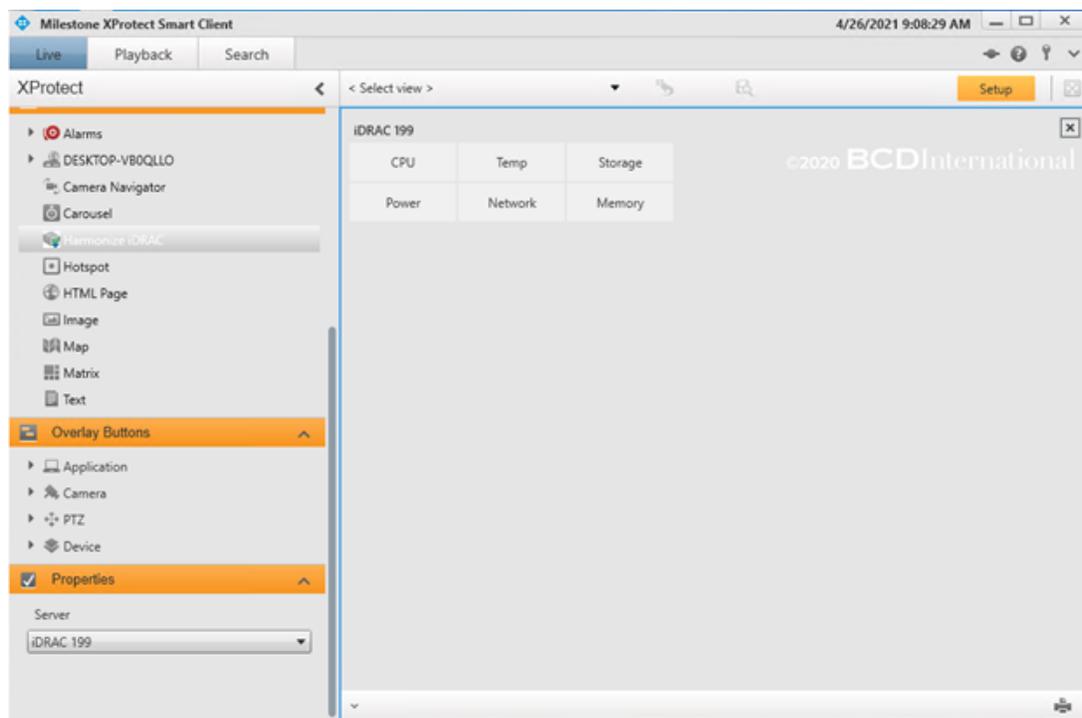

Locate the Harmonize iDRAC setup panel, and select the desired iDRAC node.

(Clean template for reference)

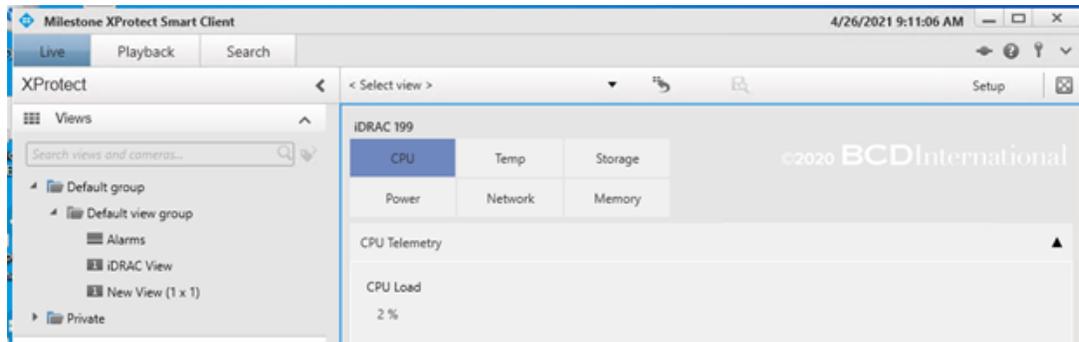

Once the iDRAC node has been selected, the pane will show the telemetry.

## Selecting Telemetry Category

Select the type of telemetry by clicking on the category selector in the panel. The telemetry values will be shown in the pane below.

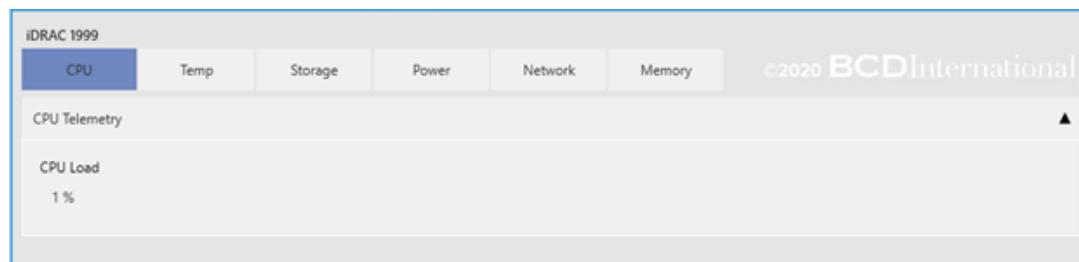

Panes can be collapsed/expanded by clicking on the pane header.

Tabular data can be sorted by clicking the column headers.

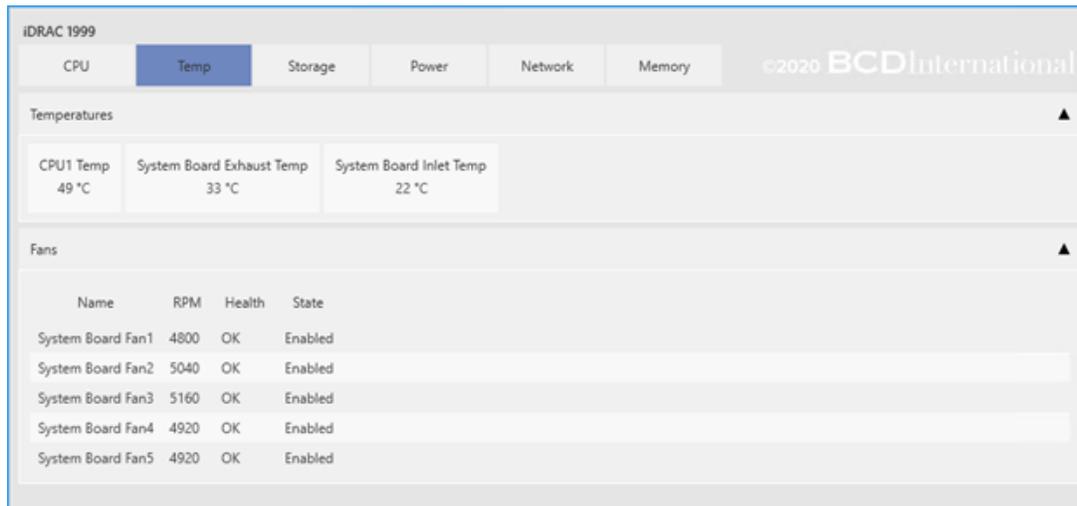

## CPU

The CPU pane shows the total CPU load on the Windows partition of the iDRAC server. The values are in percent across all cores.

## Temperature

Shows the temperature sensor readouts, fan speeds and status.

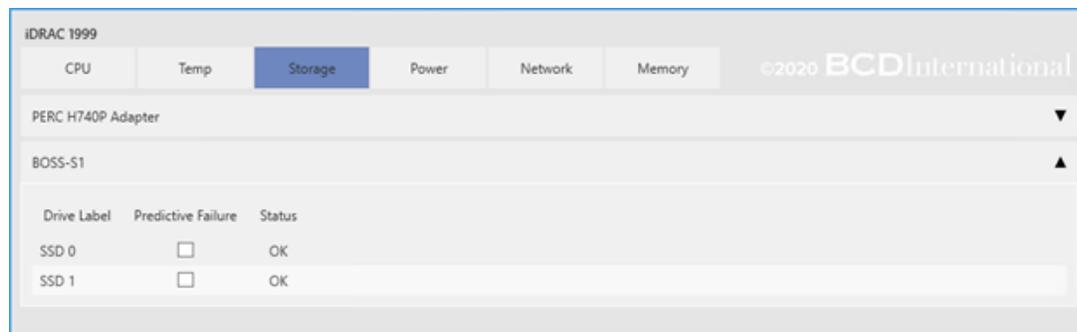

The screenshot shows the iDRAC 1999 interface with the 'Temp' tab selected. It displays temperature readouts for CPU1 Temp (49 °C), System Board Exhaust Temp (33 °C), and System Board Inlet Temp (22 °C). Below this, a table lists five system board fans with their RPM, health status (all OK), and state (all Enabled).

Name	RPM	Health	State
System Board Fan1	4800	OK	Enabled
System Board Fan2	5040	OK	Enabled
System Board Fan3	5160	OK	Enabled
System Board Fan4	4920	OK	Enabled
System Board Fan5	4920	OK	Enabled

## Storage

Shows the status of the hard drives, grouped by controller. The predictive failure checkbox is checked if iDRAC signals predictive failure on the drive.

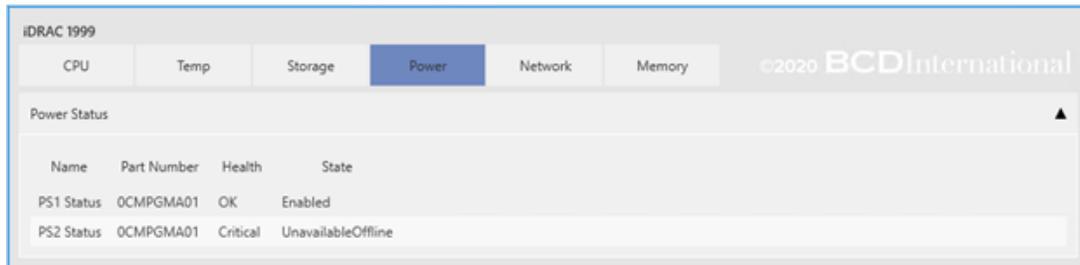

The screenshot shows the iDRAC 1999 interface with the 'Storage' tab selected. It displays the status of two SSDs (SSD 0 and SSD 1) under the BOSS-S1 controller. Both drives are in 'OK' status, and the 'Predictive Failure' checkbox is unchecked for both.

Drive Label	Predictive Failure	Status
SSD 0	<input type="checkbox"/>	OK
SSD 1	<input type="checkbox"/>	OK

## Power

Shows the status of the Power Supply Units.

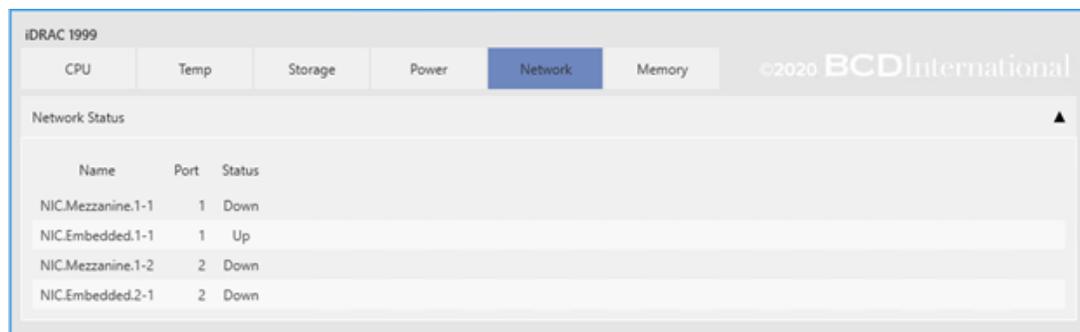

The screenshot shows the iDRAC 1999 interface with the 'Power' tab selected. The 'Power Status' section contains a table with the following data:

Name	Part Number	Health	State
PS1 Status	OCMPGMA01	OK	Enabled
PS2 Status	OCMPGMA01	Critical	UnavailableOffline

## Network

Shows the status of the network interfaces.

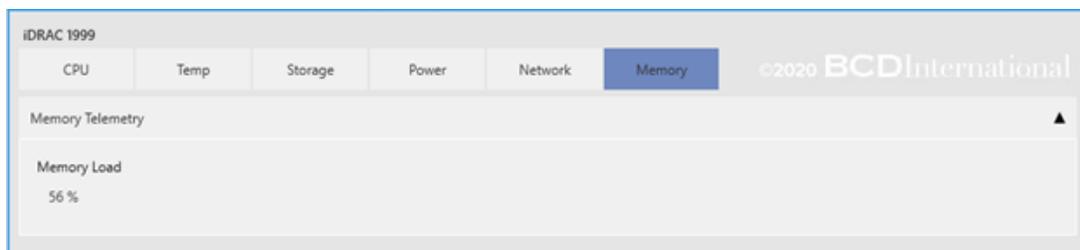

The screenshot shows the iDRAC 1999 interface with the 'Network' tab selected. The 'Network Status' section contains a table with the following data:

Name	Port	Status
NIC.Mezzanine.1-1	1	Down
NIC.Embedded.1-1	1	Up
NIC.Mezzanine.1-2	2	Down
NIC.Embedded.2-1	2	Down

## Memory

Shows the memory load (in percent of total RAM) on the Windows partition of the iDRAC server.

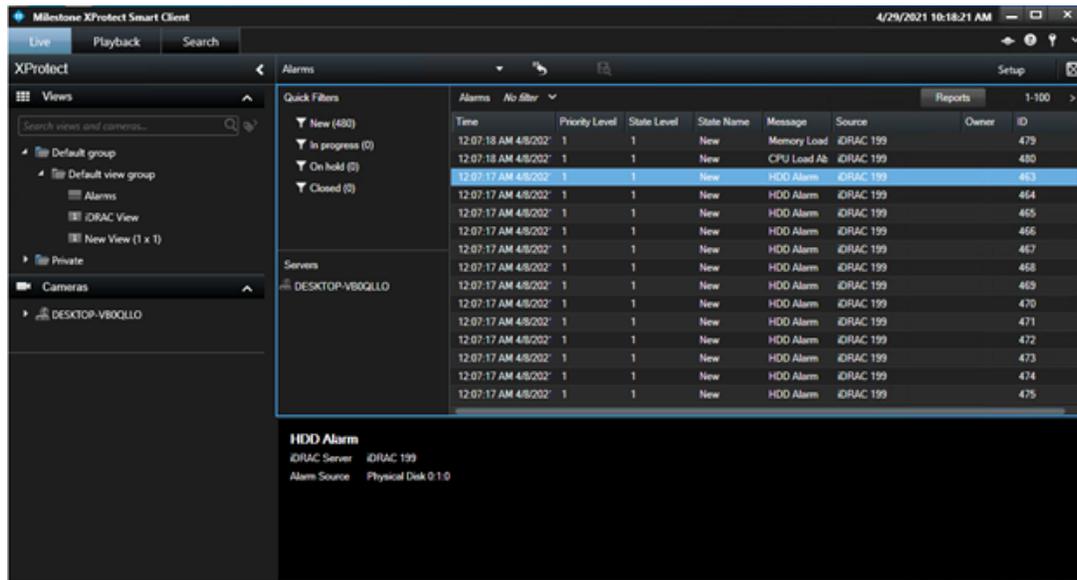

The screenshot shows the iDRAC 1999 interface with the 'Memory' tab selected. The 'Memory Telemetry' section displays the following information:

Memory Load  
56 %

## Alarms

If alarms are set up for the iDRAC plugin, the alarms will emerge in the alarm pane (refer to the Milestone XProtect documentation on how to accomplish this).

## Alarm Preview

Selecting the alarm will bring up the alarm preview pane. For iDRAC alarms, the source (iDRAC server name) and the source that triggered the event will be shown. In the example, the physical disk 0:1:0 on iDRAC 199 triggered the event.
